"Technique for Investigating Venous Circulation in the Long Bones (Osteomedullography) in the Dog."

Warsaw-Lublin, Medycyna Weterynaryjna, Vol 19, No 5, May. 63, pp 244-247.

Abstract: [Authors' English summary modified] Authors describe an osteomedullographic method (osseous phlebography) using the Polish contrast medium "Triuropan 300," as well as the normal morphological and functional findings, which are the same for all long bones. The medium gives a good x ray and does not irritate the bone marrow, while the method is safe and can be carried out aseptically. It is recommended for diagnostics of intraosseous or bone marrow diseases, particularly of benign or malignant growths in the early stages. The six references comprise four German and two Western ones.

Czekalinski A.

Czekalinski A., Ing. "The Two Algorithms"

(Dwa algorytmy) Przegląd Geodezyjny. No 1-2, 1950, pp. 15-18.

The comparison of Gauss' algorithm, which is applied to the solution of a normal equation system, with the algorithm of Banachiewicz's Cracovian root which is used for the same purpose. An exact analysis, which takes into consideration the quantities of separate calculus operation, leads to the conclusion that in certain given conditions the algorithm of the Cracovian root is more economical than Gauss' algorithm. Outstanding simplicity of the Cracovian symbolism. The possibility of basing the operation with the Cracovian root on pure algebraical principles.

„Mechanika wyznaczania spostrzeżeń pośrednich i warunkowych” Przegląd Geodezyjny No 1, 1951, pp 19-26.

The author introduces a system of symbols different from the Gauss method and suggests a scheme for solving a set of normal equations and weighted equations by means of calculating machine which, in cases where mass computations are involved, saves a considerable amount of time. The article deals in detail with the sequence of arithmetical functions and quotes a number of numerical examples.

Fertilizing value of ammonia and ammoniates. B. Kurylowicz, and A. Czekalski (Univ. Poznań, Poland). *Ročník Nauch. Rozprawy* 1978, No. 3, 5-22 (1953). MD
The main purpose of the expts. was to compare the effect of liquid NH_3 and ammoniates with that of $(\text{NH}_4)_2\text{SO}_4$ and nitrochalk. Field and pot tests were conducted on sandy clay soil with a clay subsoil, on pure quartz sand, and on clay soil. The fertilizers were applied as top dressing for sugar beets, potatoes, barley, and oats. The results of these expts. proved the pos. fertilizing effect of N in the form of liquid NH_3 . The productivity of a unit of N contained in the fertilizer expressed as crop increase per unit of N in the fertilizer used is smaller in the case of NH_3 than nitrochalk. Comparisons of the same values for NH_3 and $(\text{NH}_4)_2\text{SO}_4$ gave varying results: for sugar beets no difference was found between the two fertilizers; for barley and potatoes NH_3 showed smaller effects than $(\text{NH}_4)_2\text{SO}_4$. The productivity of a unit of N absorbed by the plant is greater in the case of the liquid NH_3 than in the case of the $(\text{NH}_4)_2\text{SO}_4$. Richard Ehrlich

Field tests on the use of urea as compared with nitro-chalk and ammoniated water. H. Burecka, W. Boguszenki, Z. Tycholka, and A. Czekalski. Rocznik Nauk Rolniczych, Ser. A, 68, 655-671 (1964). The action of N in all expts. was very clear producing yields 40% above the controls. However, going beyond the middle rate tested did not give such yields. The action of urea in small and moderate dosages was equiv. to that of nitro-chalk. Urea was noticeably weaker in action at the high dosage on rapeseed and especially barley, although giving yields equiv. to nitro-chalk with wheat and mustard. In the expts. with barley, the highest dosage of urea was even worse than the intermediate dosage. It was necessary to consider the cold spring and the fact that barley lacks tolerance in connection with the form of NH_4 , and under the conditions of the expts. urea changed its form in the soil. The action of NH_4 was equiv. to that of urea and nitro-chalk at the low dosage. At the moderate and high dosages the action of NH_4 was poorer with the exception of the expts. with rapeseed. Here again results were influenced by: (1) the mech. organization of the soil (light soil) and (2) the proportionally colder spring, which decreased the intensity of nitrification. Despite the exercising of great care during application of the NH_4OH , the method used did not completely guarantee against a loss of NH_4 . Only the repetition of the application of NH_4 with the corresponding implements in combination with expts. on larger plots can lend certainty to the accuracy of the results obtained. Eryka G. Jaworski

Title : Effectiveness of Granulated Superphosphate in Connection with Mode of Application and Soil Reaction.

Orig Pub : Roczn. nauk. rolniczych., 1956, A73, No 3, 327-347.

Abstract : Pot experiments were made in 1952 and 1953 in the Institute of Agrochemistry of the Higher Agricultural School in Poznan comparing the effectiveness of powdered and granulated P_6 with spring wheat and flax on light sandy loam having pH of 6.0 in a KCl extract. In addition, by liming, the reaction of this soil was raised to pH 6.6, and, by application of $Al_2(SO_4)_3$ in a dosage of 6 mg. Al per 100 grams of air-dry soil, to pH 5.2. Phosphates were added in doses of 40 or 120 mg. P_2O_5 per pot. When 40 mg. P_2O_5 was mixed with the otherwise unchanged soil, and distributed

35, Dip heading long wall working -- Dolesmenti halado csuzdas pasztafojtes
-- by E. Czeke (Hungarian Journal of Mining -- Banyaszati Lapok -- Vol. VI
(LXXIV), No. 4, pp. 190--199, April 1951, 2 figs., 6 tabs.)

At ordinary panel working, increased efficiency and reduction of prime costs may be achieved by further extending toward one side the presently applied narrow upcasts. After completing a working wall of 14 to 15 m in width in the direction of the dip, another wall of 12 m can be worked on the opposite side of the upcast. The cross conveyor behind the working place is driven by a gear from the main conveyor in the upcast. Wood chucks are used for securing the upcast, which can be removed gradually in the course of back-work. The results of the efficiency investigation proved that winning capacity can be raised by 85 per cent, the utilization of timber reduced by 50 per cent and prime cost decreased by 19 per cent as compared to ordinary panel working. The article is intended to serve as a guide in cost accounting.

Hungarian Technical Abstracts
Vol. 5 No. 4 1953

A table listing the data on material for mining supports is furnished for reason of comparison. It compares steel and light metal supports, prestressed concrete supports, seriously with wood because of its high bearing strength, price, specific gravity. Two prestressed, prefabricated supporting elements tested and proved are described in the article. One is a prestressed concrete slab which renders the wooden lining board unnecessary; the other is a prestressed prop shore suitable in every respect for substituting hardwood shores. Prestressed supporting elements maintain their load bearing ability for a very long time in contrast to timbering, the load bearing ability of which decreases in the function of time due to the deteriorating effect of fungi. Prestressed concrete elements can be reused several times. This circumstance together with their lasting load bearing ability renders their use economical in spite of the higher investment costs. — P. Alagöz

with the characteristics of the rock, the axial directions of compression and tension of the mountains in question must also be taken into consideration. The bedding of strata whose strike more or less coincides with the direction of the stress of the mountain should be avoided in the planning of shaft headings, pumping stations, and other works. It must be borne in mind that their direction should be approximately parallel to the direction of the mountain range geomechanically stressed by compression. The Schmidt theory of permeability is of practical importance in the determination of the probable direction of fluid water courses, as well as of the water level, by the or flow direction and for that very reason the knowledge and application of geomechanics is essential in planning mining operations.

TITLE: Enrichment of ^{37}Cl by counter-current electrolysis of fused PbCl_2

SOURCE: Nukleonika, v. 11, no. 6, 1966, 437-440 27

TOPIC TAGS: electrolysis, current density

ABSTRACT: The enrichment of ^{37}Cl was realized by countercurrent electromigration in molten PbCl_2 . The current density was 5 A/cm^2 . After 73 hr the concentration of ^{37}Cl obtained on the boundary, $\text{PbCl}_2\text{-Pb (K)}$, was 30.9%. It was calculated that in this case simple enrichment factor was 0.002. The authors thank Master Engineer Z. Wisza for his contribution. Orig. art. has: 2 figures and 1 table.

Czelnai, Rudolf, Hőmérőtermisztorok alkalmazása a mikrometeorológiai kutatásban. [Use of thermistors in micrometeorological research.] *Időjárás*, Budapest, 61(5):357-363, Sept/Oct. 1957. 8 figs., eqs. Russian summary p. 357. DLC—Possibilities and practical problems of the use of thermistors for micrometeorological temperature measurement are discussed. Data are presented on the spontaneous heating and the temperature lag of Tungsten-2TH type thermistors, as well as on the requirements to be met by such instruments. It is shown that this type of thermistor is adequate for use in the type of occasional measurements most frequent in micrometeorological research. Subject Headings: 1. Thermistors 2. Micrometeorological research.—Trans. of author's abstract.
